WHEN ORDERING PARTS, ALWAYS GIVE PART NUMBER AND DESCRIPTION.

Please note: In an effort to keep the price on Maco Antennas down, we have decided not to clean up all the burrs and rough edges on the parts. We recommend that you deburr and clean up each part with files, sandpaper, etc. so that they go together easily. We are aware this needs to be done but have elected not to do it to save you the money we would have to add to the price of the kit for this service.

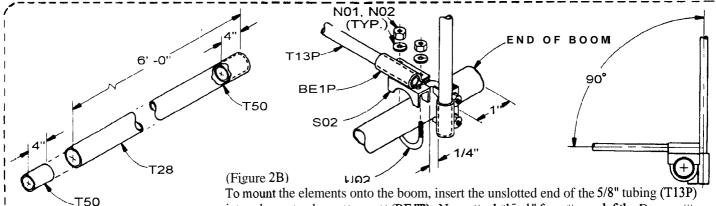

Rev: 04/09

#### MACO VQ2 QUAD

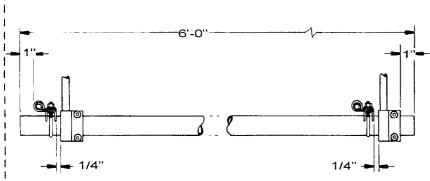

#### FIGURE 1 GENERAL ASSEMBLY INSTRUCTIONS

This figure depicts an overall view of what the antenna shouldlook like upon completion of assembly. Refer to Figures 2 through 7 for specific assembly details. All hardware should be coated with a silicon rubber sealant or similar compound to insure that wind vibration does not cause it to work loose.

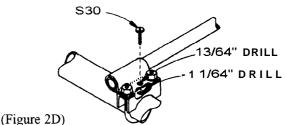

(Figure 2A)
Slide a 4" boom reinforcer (T50)
mto each end of the boom (T28) as shown.

To mount the elements onto the boom, insert the unslotted end of the 5/8" tubing (T13P) into a boom-to-element mount (BETY). Now attach this i" from the end of the Doom with a U-bolt, saddle,, and hardware as shown. Tighten the U-bolt so as to crimp the boom into an oval shape. This will prevent the element from twisting. Next, fasten a second length of 5/8" tubing to the boom in the same manner, 1/4" in from, and at a 90 degree angle to the first element mount. Tighten as before.

(Figure 2C)

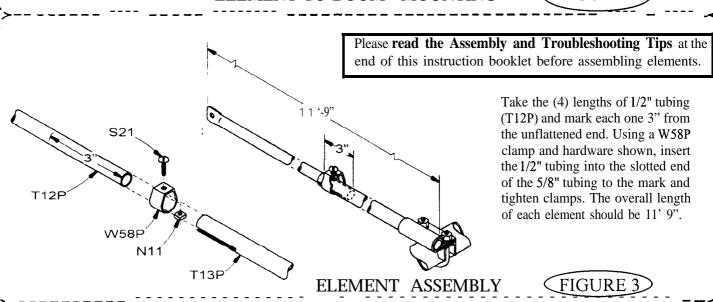

Repeat step 2B on the other end of the boom with the remaining lengths of 5/8" tubing. Be sure the elements are lined up with the ones on the opposite end of the boom and at a 90 degrees angle. Spacing on each end of the boom should be shown as above.

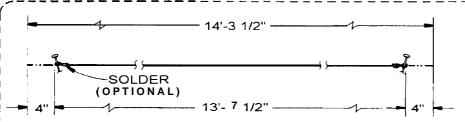

Ifyouliveinahighwindareayoumayfurtherinsure that your elements will not twist around the boom. Drill a 13/64" dia. hole thru the center of the element mount (BE 1P) & saddle (SO2). Using these holes as a guide, drill a 1 1/64" dia. hole thru one side of the boom and install the #12 x 1" sheet metal screw (S3 0). In areas with normal wind conditions this will not be necessary.

#### ELEMENT-TO-BOOM MOUNTING

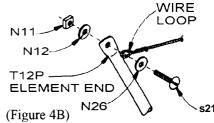

FIGURE 2

(Figure 4A)

From the 34 ft. roll of copper wire (W01P), measure and cut a length of 14' 3 1/2". Starting 4" from one end, wrap the wire around a nail or any suitable anchor and twist to form a loop as shown. Making sure that there are no kinks, pull the wire tight and measure to a length of 13' 7 1/2. this should allow you 4" to form a loop and twist in the same manner as the opposite end. Check to make sure that your overall length is 13' 7 1/2". If you desire, in order to insure a stronger and more permanent connection, you may solder the wire twists.

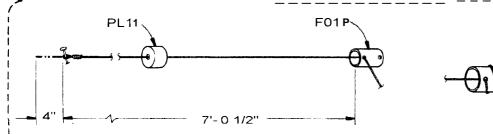

Attach the wire between the element ends on the director end of the boom using #10 hardware as shown. It is normal for the elements to bow towards each other. This will cause a spring action and keep any slack out of the wire.

#### DIRECT WIRE ASSEMBLY

PL10

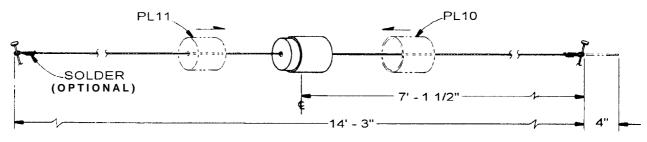

(Figure 5A)

Using the remaining copper wire, start 4" from one end and wrap it around a nail or suitable anchor and twist to form a loop. Next string the loose end of the wire thru the hole in the smaller of the two plastic caps (PL11). Now string the wire thru one of the holes in the coilform (FO 1P) from inside to out as shown and slid the coilform over the wire to bring its front edge to a distance of 7' 1/2" from the loop end.

#### (Figure 5B)

Wind the wire 3 turns around the coilfonn, maintaining equal spacing between the turns and keeping the coilfonn in its same position on the wire. String the wire thru the hole in the other end of the coilfonn. Next string the loose end of the wire thru the hole in the larger plastic cap (PL10).

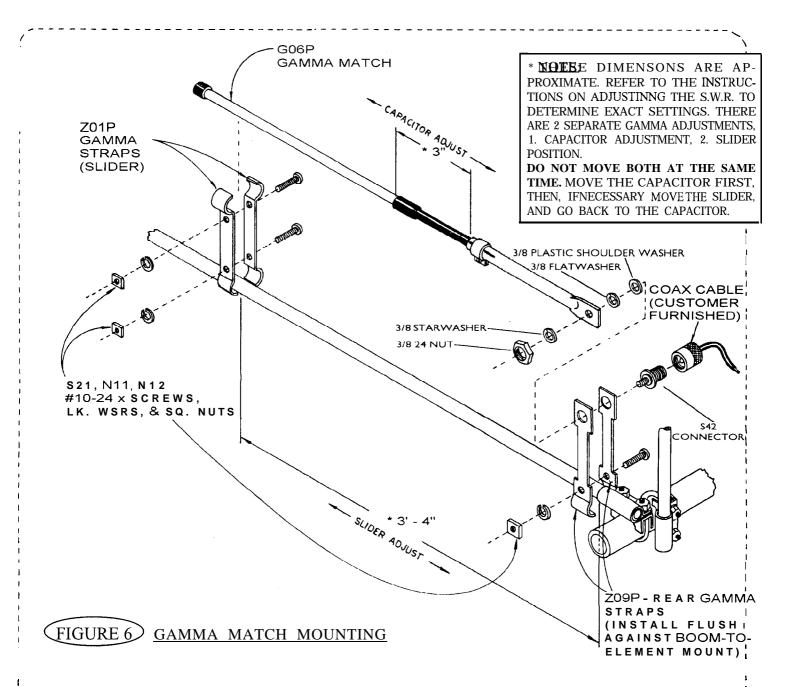

(Figure 5C)

Making sure there are no kinks, pull the wire tighten and measure 14' 3" from the loop end of the wire. Allowing 4" for wrapping, cut off any excess and form a loop in the same manner as the opposite end. Now push the small plastic cap over one end of the coilfonn is in the center of the wire, and that the overall length is 14' 3". Solder your wire twists if desired. Now attach the wire & coil assembly between the element ends on thee reflector end of the boom using the #10 hardware. (Refer to Fig. 4B)

REFLECTOR WIRE ASSEMBLY

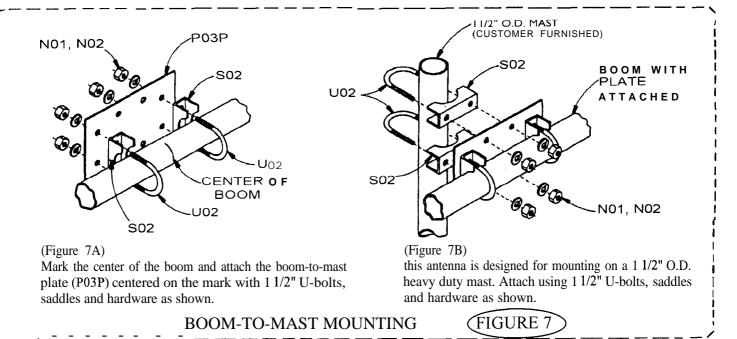

Attach the Gamma Match (G06P) to the driven element on the director end of the boom (ref. Fig. 1) using the Gamma Straps (Z01P, Z09P) and attaching hardware as shown. Attach your coaxial cable to the connector (S42) and dress along boom and down mast.

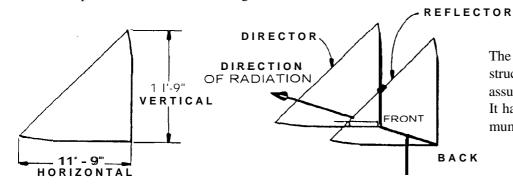

#### ADJUSTING STANDING WAVE RATIO

The dimensions given are approximate and should be used as a starting point.\*

The Gamma Match has 2 adjustments. First is the capacitor adjustment and second is the slider adjustment. Connect a S.W.R. bridge between your transmitter and the antenna and check the S.W.R. If adjustment is requiredloosen the clamp on the gammamatch and the screws holding the slider (Gamma Straps ZO 1P. Next move the capacitor adjustment first in one direction, then the other until a minimum S.W.R. reading is obtained. If S.W.R. is not satisfactory, move the slider out 2" towards the boom. Now readjust the capacitor for a minimum S.W.R. You should now be able to determine which direction to move the slider. Repeat the above procedure, moving the slider in smaller incrementsuntil a satisfactory S.W.R. reading is obtained. Tighten all hardware. Disconnect the S.W.R. bridge and reconnect your coaxial cable.

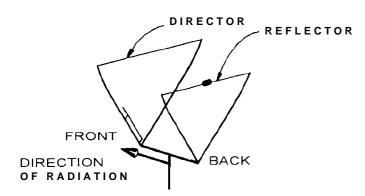

The VQ2-Quad offers CBer's the advantages of both horizontal and vertical polarization with only one coax. feed line. The "V" configuration gives outstanding gain and pin point rejection. Experienced CBer's know how annoying fading due to polarization loss can be. With the dual polarity of the VQ2-Quad, signal fading is reduced as much as 20 Db. Both horizontal and vertical polarization is achieved through the VQ2-Quad loop configuration. Low loss impedance matching Gamma Match assures low S.W.R. for maximum power transfer. A pretuned reflector resonating coil assures max. F/B ratio.

The VQ2-Quad's rugged mechanical structure of top grade aluminum tubing assures long lasting dependable service. It handles up to 2000 watts with maximum power transfer.

For both horizontal and vertical polarization, mount in configuration above.

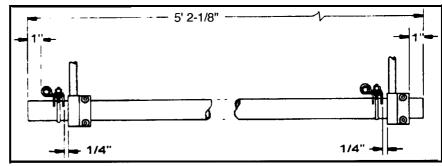

For horizontal polarization, mount as shown here in configuration above.

#### Mechanical Specifications:

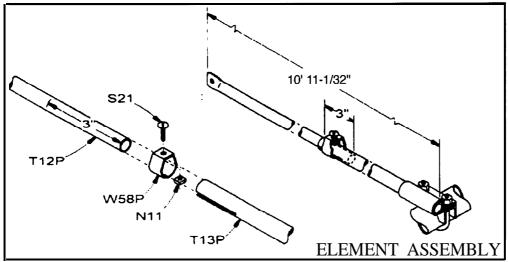

Boom Length . . . . . . . 6' 0"
Element Length . . . . . . . . . . . . . . . . . . 11' 9"
Accepts masts up to . . . . . 1.5"
Wind survival . . . . . . . . . . . . . . . . . . 100 MPH
Net Weight . . . . . . 7.4 lbs.

#### Caution:

Take Care To Avoid Any Contact With Overhead Powerlines When Raising, Installing, or Repairing Your Antenna, Tower, or Rotor. Death Will Occur!

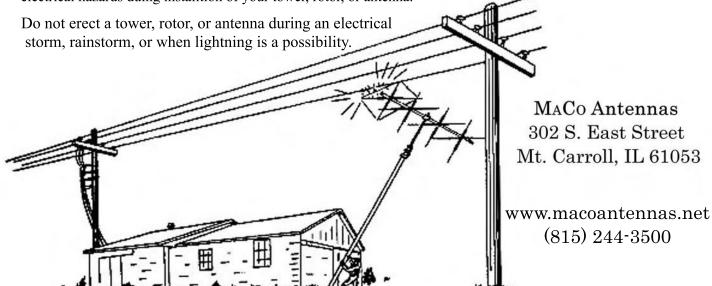

Installing and rigging towers, masts and antennas require specialized skills and experience. Information supplied by MaCo assumes that all products will be installed by personnel having these skills and have installed similar products before. No one should attempt to install towers or masts without these knowledgeable skills.

MaCo assumes no liability if faulty or dangerous installation practices are used. There are available, trained and experienced personnel to assist in installation, maintenance, or dissassembly. Contact your local installer if consultation or assistance is required.

All tower and antenna installations should be throughly inspected at least twice a year by qualified, experienced, and trained personnel to insure proper performance and safety standards.

#### **Electrical Warning**

An additional warning precaution is given to be careful of surrounding high voltage power wires and other electrical hazards duing installtion of your tower, rotor, or antenna.
